Energy

ERP Advisors Group (EAG) is one of the top independent enterprise software advisory firms for energy companies.

Having the right software to handle large capital projects, complex international accounting, regulatory compliance, and intricate asset management is a major differentiator for energy companies.

Energy companies are looking to replace manual processes in the field and in their operational process with software solutions that can provide faster insights into actual costs. This allows management to make better and faster decisions, especially in rapidly-changing commodities markets. ERP Advisors Group can help energy companies differentiate the rich functionality of best-of breed industry solutions against general ERP solutions that provide more of a platform play for the future.

Practical Deliverables

ERP Advisors Group will help your Energy company define requirements, set your software strategy, provide a roadmap, conduct a diligent vendor selection process and manage the entire implementation.

- **Develop Your ERP Strategy** We will define your needs and wants as well as how you would ideally use new automated solutions across your entire energy company.

- **Select Your New Software** We will guide you through selecting the best-fit, most cost-effective business applications and implementation partners.

- **Implementation Project Management** After finalizing your software and services contracts, EAG stays with you to oversee your implementation until you successfully go live. We will oversee integrations, data migration, change management, budgets, design and configuration, walkthroughs, training, testing, go-live cutover and will provide executive and project sponsor support throughout the duration of your project.

- **Data Migration** We assist with all components of data migration: extraction, cleansing, transformation and loading into your new system to ensure you have complete confidence in the accuracy of your data at go live.

We started our own process of selecting new software and decided to engage EAG after another oil and gas company referred them to us. They are knowledgeable and very engaged in the entire process. Having them on our team gives us peace of mind knowing that experts are looking out for our best interest. It is easy working with them.

Eric Guy, Controller

Why Energy Companies Upgrade Their ERP Software

Surveys across all of our energy clients reveal the most common reasons why they need new ERP to automate their business:

- Manual intervention is required for basic tasks revolving around fleet tracking, equipment servicing, work orders, emissions tracking, etc.

- Not provided with accurate, up-to-date information on financials, equipment information, budget to actuals on spend, and more.

- No automated tracking of inventory borrowed or used across plants, creating unnecessary, time-comsuming workarounds.

- Cannot do fleet-wide maintenance within legacy software due to inefficient system setup and plant segregation.

- Extreme difficulty maintaining, reporting, and retiring fixed assets due to heavy manual intervention.

- Cash forecasting is difficult within legacy software, causing additional work, constant adjustment, and producing inaccurate results.

- Manual tracking, calculation of depreciation, and entry into legacy software are time-consuming and inefficient.

- Work-in-progress project detail is lost in legacy software.

> *I've been through some rough ERP implementations before and I must say that ERP Advisors Group made selecting and implementing the right software a smooth and fairly effortless process. They are right there with us every step of the way lending expert advice and helping us manage the project.*

James Evans, CFO
ROCKPILE ENERGY SOLUTIONS

Energy ERP Vendors

ERP Advisors Group will help you not only define your requirements but more importantly, we will bake in the best practices for your energy company into your Request for Information and Demonstration Script.

We conduct dozens of selections every year, equating to tens of millions of dollars in software and services sales. With our deep knowledge of energy ERP, we will help you find the right energy ERP for your company, AND the right professional services company to implement it.

We regularly vet the top, most viable energy ERP systems.
